Identity Management

Single sign-on has evolved from a convenience to a necessary component in the security landscape.

By simplifying identities for end users to a single identity across all apps and infrastructure helps to strengthen a proper IAM lifecycle. Many components are involved with a proper Identity lifecycle – onboarding offboarding, usernames, password policies, and access management.

Part of a Zero Trust architecture is a strong identity management solution. The largest attack vector within a company are user identities. Everyone has one, and that leaves an intersect point for a hacker.

Logicalis can assist with creating a modern cloud/hybrid-based identity strategy leveraging the most used IDP in the world, Microsoft Azure Active Directory (Azure AD).

Microsoft sees over 30+ billion authentication requests per day, allowing them to collect behavioral information about users to help prevent a fraudulent log in.

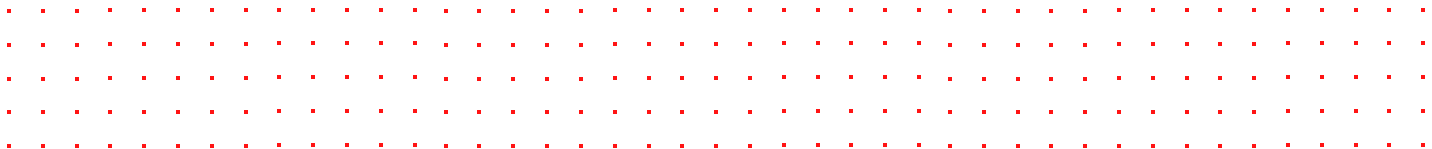

Identity is the control plane

Secure access for a connected world

Logicalis's experts in Identity & Collaboration, part of our Digital Workplace portfolio, will work with you to create a cloud/hybrid-based identity to enable a seamless, secure access management solution.

With features including self-service password reset, multi-factor authentication (MFA) with conditional access, and single sign-on (SSO), this solution provides a better user experience while creating a more secure environment.

We use a 3-phased approach to develop a comprehensive program to modernize endpoint management with your outcomes and goals in mind.

Align — Assessment of current state and business goals to determine the right roadmap to get to a fully managed identity management solution

Transform — Creation of a program to assist with deployment and configuration of this new cloud-based identity management platform.

Scale — Logicalis will fully manage this platform through a proactive lifecycle approach.

The Digital Workplace Identity Solution includes the following:

- M365 Application Suite (online)
- Azure AD (Users, Groups)
- User onboarding/offboarding
- New M365 Group, Distribution & Mailbox
- MFA – Azure AD/ Cisco DUO
- Collaboration – Microsoft Teams and Webex Teams
- License management
- Conditional access – AAD
- AD membership/ Group membership
- AD object management
- AD user profile management
- Azure Information Protection (sensitivity labelling, data loss prevention, retention)
- Risky users/sign-In
- Self-service password reset/unlock

Our proven approach helps you along

the journey to achieve employee empowerment

Our proven methodology helps you along the journey towards achieving scalable, innovative workplace solutions.

Step 1 Align

Collaboration Assessment

Collaboration capabilities and technology assessment including a gap analysis and solution roadmap.

Step 2 Transform

Collaboration Suite Implementation

Collaboration suite deployed against a best practice benchmark score to ensure adoption and productivity at speed.

Step 3 Scale

Managed Collaboration Suite

Proactively manage and improve your collaboration score ensuring employees are productive.

Contact your Logicalis Account Executive to setup a **Identity Management workshop** to help determine the roadmap to a Zero Trust architecture.
